The Harvard list of books in psychology was first compiled in the 1930s when each student in the department enjoyed the luxury of an individual tutorial. Together, tutor and student could map out a course of reading. By 1938 the list had proved so useful that its 349 titles were annotated and printed. Though mainly for local consumption, growth of an outside demand led to a supplement in 1944 and a number of successive editions bearing the present title. The present edition updates the list without expanding it beyond useful size. For each new title the compilers have faithfully tried to delete one and new entries account for almost half of the present total of 744. Each title is annotated with descriptive and evaluative material.

This textbook titled physiological psychology covers the general area of brain and behavior, which is a modular subject in many university courses. The authors attempt to prepare students to understand physiological concepts in other specialized fields. The book is organized into four chapters. The first chapter covers the areas of brain and behavior, which includes techniques in neurophysiology. The neuron and its functions, central nervous system (CNS) autonomous nervous system (ANS) sympathetic nervous system (SNS) parasympathetic nervous system (PSNS) neurotransmitters, and drug action. The second chapter deals with the biological basis of sensory processes, including visual, auditory, gustatory, olfactory, and cutaneous systems. The third chapter contains the physiological basis of sleep, eating, drinking, and sexual behavior. The last chapter covers the areas of emotion, learning, and memory.

excerpt from an introduction to applied psychology there is one fact about the study of human nature
that causes every teacher no end of amazement this fact is that the student even of a book on
applied psychology will suppose that the events he reads about and the conclusions that are drawn
must concern some other person than himself this very day for example the reader of these lines will
have been attracted by an advertisement signed for some insurance that he did not want remarked
the strange differences between himself and his friends followed a custom either in clothing in
political opinion on in social attitude used an awkward method of learning an oration given unreliable
testimony about an accident forgotten the name of a familiar person suffered from some one of the
many forms of maladjustment or found himself ill adapted to his curriculum but when he reads about
the psychological side of these various episodes he will still not believe that he is discovering any
information that pertains to his own conduct nothing can be so plain as the fact that the persons who
study this book are the persons of whom the experimental psychologist speaks and writes that most
of us do not know this to be true is due in part to our own lack of imagination and in part to the way in
which the facts and principles of psychology are presented to us so far as the student is concerned
every attempt has been made in the following pages constantly to remind him that he is looking at a
fairly accurate photograph of himself and of his doings the only way to know what the science of
human nature is about and how it can be applied to various situations is to remember the situations
in which the reader himself has been placed or to imagine those in which he may be placed he must
remember also what he and others did and thought about them about the publisher forgotten books
