the studies presented in this book should be of interest to anybody concerned with the teaching of arithmetic to young children or with
cognitive development in general the eaching experiment was carried out with half a dozen children entering first grade over two years in
biweekly sessions methodologically the authors research is original it is a longitudinal but not a naturalistic study since the experimenter
teachers directed their interaction with each individual child with a view to his or her possible progress it is experimental in the sense that
two groups of subjects were selected according to criteria derived from an earlier study steffe von glasersfeld richards cobb 1983 and that
the problems proposed were comparable though far from identical across the subjects but unlike more rigid and shorter learning or training
studies it does not include pre and posttests or predetermined procedures theoretically the authors subscribe to piagefs constructivism
numbers are made by children not found as they may find some pretty rocks for example or accepted from adults as they may accept and
use a toy the authors interpret changes in the children s counting behaviors in terms of constructivist concepts such as assimilation
accommodation and reflective abstraction and certain excerpts from protocols provide on line examples of such processes at work they also
subscribe to vygotsky s proposal for teachers 0 utilize the zone of proximal development and to lead the child to what he can not yet do
