Kidney transplantation is a complex field that incorporates several different specialties to manage the transplant patient. This book was created because of the importance of kidney transplantation; this volume focuses on the complexities of the transplant patient in particular there is a focus on the comorbidities and special considerations for a transplant patient and how they affect kidney transplant outcomes. Contributors to this book are from all over the world and are experts in their individual fields; they were all individually approached to add a chapter to this book and with their efforts, this book was formed. Understanding the complexities of kidney transplantation gives the reader an excellent foundation to build upon to truly understand kidney transplantation with the increased prevalence of kidney transplantation, transplant recipients are being treated in a variety of clinical settings often beyond the transplant center. There is a greater need for clinicians and allied healthcare professionals to have appropriate guidance on managing these patients. Kidney transplantation offers the latest evidence-based information on the full range of dilemmas in the medical management of kidney transplant recipients before and during and after transplantation beginning with the selection of patients who are candidates for transplantation. This authoritative guide covers the care of the patient on the waiting list and evaluation of donors, preoperative care, induction and immunosuppression maintenance, this wealth of new information and guidelines will serve as an important resource for the best possible care for transplant patients. This publication reviews the immunology of transplant rejection as the basis for modern immunosuppression protocols; it also looks at the current criteria for selection of kidney transplant recipients and donors despite significant accomplishments to date kidney transplantation is a relatively young field in medicine due to the armamentarium of agents available to effectively suppress the immune system. In the past decade, there has been a shift in focus from prevention of rejection to a focus on extending the life of the allograft and novel strategies to increase the organ donor pool. This book covers basic concepts in kidney transplantation while also addressing ways to manage kidney transplant recipients in order to maximize patient and graft survival in addition novel concepts to increase organ availability are addressed including kidney paired donation and single site laparoendoscopic donor nephrectomy for living donor kidney transplantation and utilization of marginal hepatitis C positive and older donor organs. The increase of deceased donor transplant opportunities this popular handbook is a practical guide for physicians, surgeons, nephrologists, and other professionals who manage kidney transplant patients. It is concise, readable, and well-illustrated chapters outline the major concerns surrounding renal transplantation and the most successful approaches to problems arising in short and long term patient care. Chapter topics include immunobiology and immunosuppression as well as chapters on surgery, histocompatibility, and the first three months post-transplant surgery. This thoroughly updated fifth edition includes new information on options for patients with end stage renal disease, immunosuppressive medications and protocols for kidney transplantation and the first two months following transplant. Michael F. A. Woodruff, Emeritus Professor of Surgery, University of Edinburgh, this book grew out of a very successful conference on organ transplantation held in Kuwait in December 1982. The material presented at the conference has been expanded and brought up to date and the result is a well-written and authoritative account of many aspects of organ transplantation by a distinguished team of contributors drawn from many countries. A unique feature of the book is the account it contains of the development of organ transplantation in the middle east as it has been virtually impossible in Islamic countries to take organs after death for use as transplants. It is beginning to look as if this situation may change in the future with the establishment of the first kidney transplant in the Middle East in 2011. Meanwhile, the account it contains of the development of organ transplantation in the Middle East although as yet it has been virtually impossible in Islamic countries to take organs after death for use as transplants, it is beginning to look as if this situation may change in the future with the establishment of the first kidney transplant in the Middle East in 2011.

than 110 clinical photographs and illustrations to enhance learning key points provides clinicians with recent developments in anaesthesia for transplant surgery covers techniques for transplant surgery of different organs in body emphasis on importance of history taking and thorough clinical examination includes more than 110 clinical photographs and illustrations as recent advances in immunosuppression and apheresis techniques have opened new avenues for the management of humoral immunity interest in abo incompatible kidney transplantation has been renewed moreover new screening techniques such as the single antigen bead assay allow for the detection and definition of very low levels of alloantibody which has had a positive impact on the treatment possibilities in highly sensitized adult patients with end stage renal disease but despite these advances a theoretical rationale is still missing for both the decision to transplant a sensitized patient and the classification of the transplant as low medium or high risk there is also no uniform approach with regard to pre transplant desensitization protocols and it is unclear whether particular post transplant immunosuppression will be required and what would be the best combination treatment last but not least the frequency and actual clinical impact of alloantibodies developed after transplantation on short and long term graft survival need to be ascertained especially at the clinician this publication presents recent insights in the characterization and pathogenetic role of humoral immunity in chronic allograft injury and investigates the perspectives for novel immunosuppressive therapies to control antibody production after transplantation this concise monograph examines the novel and distinct feature of blood transfusion it critically reviews the areas of major concern to the public and scientific medical community topics include transmission of disease s from the blood donor to the recipient and the transfusion induced alloimmunization of the recipient it induced immunomodulatory effects both beneficial and deleterious beneficial effects in clinical organ transplantation and in treatment of women with unexplained recurrent abortions adverse effects of bt in patients undergoing curative surgery for different types of cancer and in patients at risk kidneys in ever increasing numbers more than 10000 renal allografts have now been reported to the transplant registry with related donors 75 of grafted kidneys continued to function after 2 years compared with 50 when the donors were unrelated the therapeutic value is obvious but the management is largely empirical and results have improved little in the past 5 years the basic sciences related to tissue transplantation have advanced rapidly new serological and tissue culture techniques and chemical analysis of antigens and anti bodies have produced complicated data that is almost incomprehensible to the non specialist mathematical treatment of genetic probabilities and of immunological kinetics are similarly difficult to follow for those not especially trained there has always been a gulf between the practical clinician whose patients do not behave like inbred rodents and the biologist who likes carefully controlled experiments with easily observed results both realize however that predictable and safe control of rejection must involve close collaboration and cooperation between the laboratory and the clinic unfortunately the different nature of the work and the workers has widened the gap between them the clinicians tend to improve their techniques and patient care while the biologists seek clearer and more precisely defined experiments which lead them to use increasingly artificial experimental models dr richard polin s neonatology questions and controversies series highlights the toughest challenges facing physicians and care providers in clinical information is available at scholarlyeditions com this is the book s first title that focuses exclusively on kidney disease and its impact in the cardiac catheterization laboratory the increasing prevalence of vascular risk factors such as diabetes obesity and hypertension coupled with increased longevity has resulted in a worldwide epidemic of cardiovascular and chronic kidney disease ckd never has the impact of one organ system on the other been so profound as in the current context of cardiac renal interactions the cross talk between the heart and kidneys is highly relevant in the field of interventional cardiology given the increasing number of trans catheter procedures being performed in patients with underlying kidney disease these procedures also have a significant impact on kidney function and require thoughtful interdisciplinary planning by a cardirenal team to achieve optimal outcomes this book assembles the collective expertise of several international leaders in the field of interventional cardiology and nephrology to summarize this complex interface the book is divided into seven sections to comprehensively cover the topic including sections on best practices with reduction of contrast associated acute kidney injury cutting edge techniques to minimize kidney risk with complex interventions impact of transcatheter valvular procedures on kidney function and the utility of cardio nephrology teams less recognized complications with high morbidity such as athero embolic renal disease are featured prominently to increase awareness in the interventional cardiology and nephrology communities this book is a valuable resource for interventional and structural cardiologists general cardiologists and nephrologists dealing with the significant overlap areas between these two specialties it is also relevant to medical students trainee physicians in nephrology and cardiology advanced care practitioners and nursing personnel in both specialties given the major impact of kidney function on outcomes in patients undergoing cardiac procedures this textbook serves as a focal point to integrate relevant clinical data

Humoral Immunity in Kidney Transplantation 2009 r y calne surgeons are transplanting kidneys in ever increasing numbers more than 10000 renal allografts have now been reported to the transplant registry with related donors 75 of grafted kidneys continued to function after 2 years compared with 50 when the donors were unrelated the therapeutic value is obvious but the management is largely empirical and results have improved little in the past 5 years the basic sciences related to tissue transplantation have advanced rapidly new serological and tissue culture techniques and chemical analysis of antigens and anti bodies have produced complicated data that is almost incomprehensible to the non specialist mathematical treatment of genetic probabilities and of immunological kinetics are similarly difficult to follow for those not especially trained there has always been a gulf between the practical clinician whose patients do not behave like inbred rodents and the biologist who likes carefully controlled experiments with easily observed results both realize however that predictable and safe control of rejection must involve close collaboration and co operation between the laboratory and the clinic unfortunately the different nature of the work and the workers has widened the gap between them the clinicians tend to improve their techniques and patient care whilst the biologists seek clearer and more precisely defined experi ments which lead them to use increasingly artificial experimental models
